

ABSTRACT

A device for reshaping a cardiac valve (26), which
5 is elongate and has such dimensions as to be insertable
into a cardiac vessel (24). The device has two states, in
a first state (K) of which the device has a shape that is
adaptable to the shape of the vessel (24), and to the
second state (k') of which the device is transferable
10 from said first state (K). Further, the device comprises
a fixing means (22,23;22a,23a) for fixing the ends of the
device within the vessel (24), when the device is first
positioned therein, a shape-changing member (20;20a) for
transferring the device to the second state (K') by
15 reshaping it, and a delay means (21;21a) for delaying
said reshaping until the fixing of the ends of the device
has been reinforced by keeping said device in said first
state (K) until the delay means (21;21a) is resorbed.
